

Cuisinier production commences

Santos, Bow Energy, Avery Resources and Victoria Petroleum have commenced production from the modest Cuisinier oil field some 6km west of the Santos operated Cook oil field in the Cooper Basin, Queensland.

Production is expected to begin at 340 bopd with regular shipments to the Jackson facility.

Cuisinier-1 is the first well drilled on the 3D-defined Cuisinier structure.

Further appraisal and development of the oil discovery are planned.

Cuisinier-1 produces from the Murta Sandstone rather than the underlying prolific Hutton Sandstone which produces at Cook, however there is potential for the Hutton sandstone within the new field.

Cuisinier is interpreted from current seismic data to possibly be one of several culminations in the area of the ATP 752P (Barta Block).
